

SENSE OF TOUCH

Elephant Stomp

Fun Fact!

Elephants learn about their surroundings from feeling vibrations under their feet.

To warn other elephants of danger, they stomp their feet to create vibrations that other elephants can feel even miles away!

USE YOUR SENSE OF TOUCH

To feel vibrations

- Stomp one foot on the ground three times.
- Can you feel any vibrations under your foot when you stop stomping?

SENSE OF TOUCH

Elephant Trunk Swing

Fun Fact!

Elephants “feel” the ground with their trunks to make sure they can step safely.

Information from your skin, muscles, and joints helps you know how to position your body and the kind of surface you step on. Is it hard, soft, slippery, or uneven?

USE YOUR SENSE OF TOUCH

To feel different textures/surfaces

- Make a pretend trunk by interlocking your fingers. March around and swing your pretend trunk from side to side.
- Use your hands to find and feel different textures: soft or hard, smooth or rough.
